Lab-4

Arithmetic Operations – Part 2 – CS2523

Table of Contents

1. Introduction	31
1.1 Addition	31
1.2 Subtraction	31
1.3 Multiplication	31
1.4 Division	31
2. The Basic Arithmetic Properties	32
2.1 Commutative Property	32
2.2 Associative Property	32
2.3 Distributive Property	32
3. Objective	32
4. Walkthrough Task	33
5. Procedure& Tools	33
5.1 Tools	33
6. Practice Tasks	34
6.1 Practice Task 1	34
6.2 Practice Task 2	34
6.3 Practice Task 3	34
6.4 Practice Task 4	35
6.5 Out comes	35
7. Evaluation Task	35
8. Evaluation criteria	35

1. Introduction

The four basic arithmetic operations are addition, subtraction, multiplication and division. Apart from this we will cover increment and decrement operator as well in this lab.

1.1. Addition

Addition is the most basic operation of arithmetic. In its simplest form, addition combines two quantities into a single quantity, or *sum*. For example, say you have a group of 2 boxes and another group of 3 boxes. If you combine both groups together, you now have one group of 5 boxes. To represent this idea in mathematical terms:

2 Boxes + 3 Boxes = Will result in 5 Boxes

1.2. Subtraction

Subtraction is the opposite of addition. Instead of adding quantities together, we are removing one quantity from another to find the *difference* between the two. Continuing the previous example, say you start with a group of 5 boxes. If you then remove 3 boxes from that group, you are left with 2 boxes. In mathematical terms:

5 Boxes – 3 Boxes = Will result in 2 Boxes

1.3. Multiplication

Multiplication also combines multiple quantities into a single quantity, called the *product*. In fact, multiplication can be thought of as a consolidation of many additions. Specifically, the product of xx and yy is the result of xx added together yy times. For example, one way of counting four groups of two boxes is to add the groups together:

$$2+2+2+2=8$$

However, another way to count the boxes is to multiply the quantities:

$$2 * 4 = 8$$

Note that both methods give you the same result—8—but in many cases, particularly when you have large quantities or many groups, multiplying can be much faster.

1.4. Division

Division is the inverse of multiplication. Rather than multiplying quantities together to result in a larger value, you are splitting a quantity into a smaller value, called the *quotient*. Again, to return to the box example, splitting up a group of 8 boxes into 4 equal groups results in 4 groups of 2 boxes:

$$8 \div 4 = 2$$

2. The Basic Arithmetic Properties

2.1. Commutative Property

The commutative property describes equations in which the *order* of the numbers involved does not affect the result. Addition and multiplication are commutative operations:

- $2+3=3+2=5$ $2 \cdot 3=3 \cdot 2=6$
- $5 \cdot 2=2 \cdot 5=10$

Subtraction and division, however, are not commutative.

2.2. Associative Property

The associative property describes equations in which the *grouping* of the numbers involved does not affect the result. As with the commutative property, addition and multiplication are associative operations:

- $(2+3)+6=2+(3+6) = 11$
- $(4 \cdot 1) \cdot 2=4 \cdot (1 \cdot 2) = 8$

Once again, subtraction and division are not associative.

2.3. Distributive Property

The distributive property can be used when the sum of two quantities is then multiplied by a third quantity.

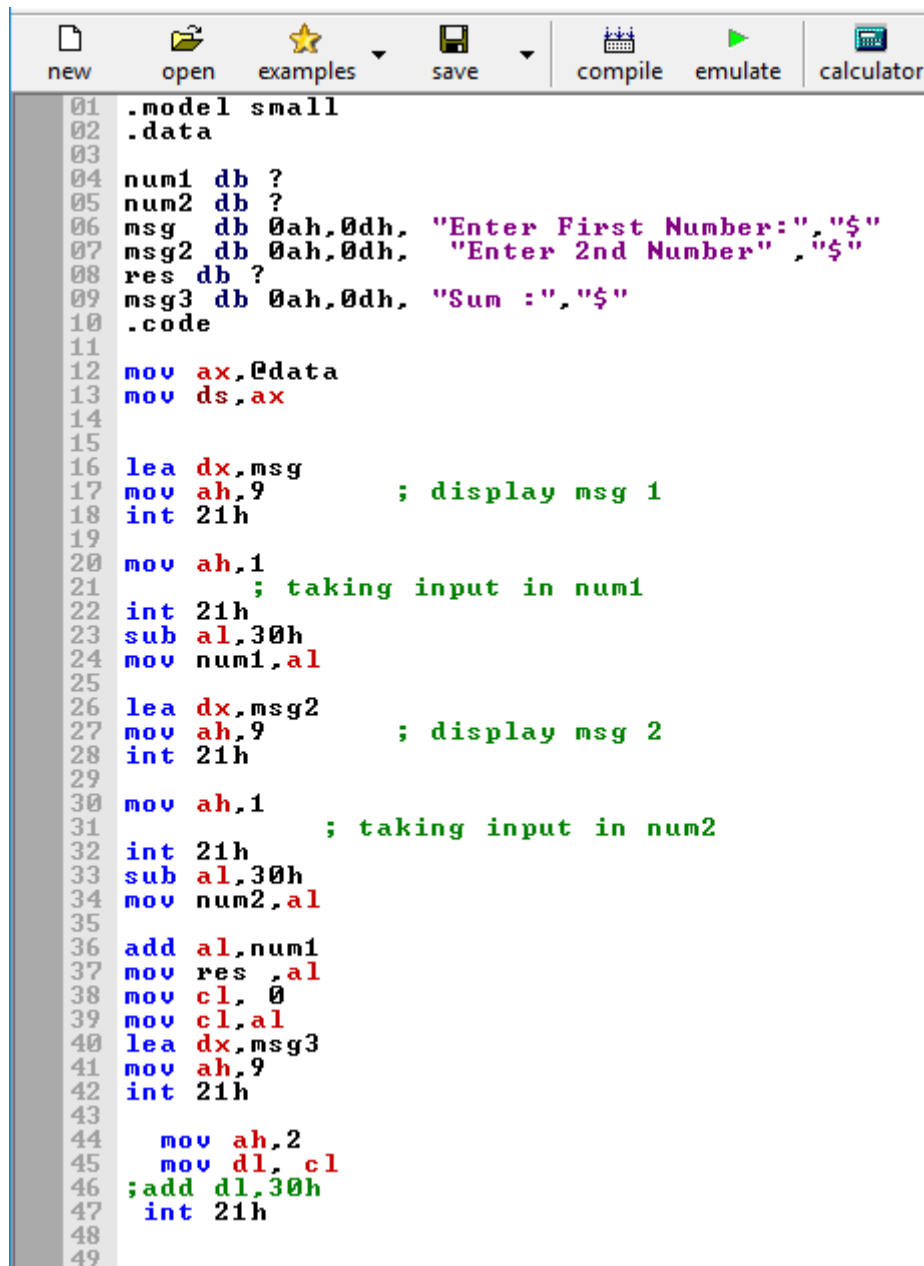

- $(2+4) \cdot 3=2 \cdot 3+4 \cdot 3=18$

3. Objective

- To get basic understanding of arithmetic operation in Assembly Language.
- Arithmetic properties
- To get an understanding of number representation in ascii format.

4. Walkthrough Task

The above program shows the input of two numbers and add them and store the result in res variable.

```
01 .model small
02 .data
03
04 num1 db ?
05 num2 db ?
06 msg db 0ah,0dh, "Enter First Number:","$"
07 msg2 db 0ah,0dh, "Enter 2nd Number" ,"$"
08 res db ?
09 msg3 db 0ah,0dh, "Sum :","$"
10 .code
11
12 mov ax,@data
13 mov ds,ax
14
15
16 lea dx,msg
17 mov ah,9 ; display msg 1
18 int 21h
19
20 mov ah,1
21 ; taking input in num1
22 int 21h
23 sub al,30h
24 mov num1,al
25
26 lea dx,msg2
27 mov ah,9 ; display msg 2
28 int 21h
29
30 mov ah,1
31 ; taking input in num2
32 int 21h
33 sub al,30h
34 mov num2,al
35
36 add al,num1
37 mov res,al
38 mov cl,0
39 mov cl,al
40 lea dx,msg3
41 mov ah,9
42 int 21h
43
44 mov ah,2
45 mov dl,cl
46 ;add dl,30h
47 int 21h
48
49
```

5. Procedure& Tools

Procedure and tools installation discussed in first lab (Lab01).

5.1. Tools

- Open emu8086.
- Make new project.
- Enter your code.
- Click on Emulate.
- Click on Run.

6. Practice Tasks

This section will provide more practice exercises which you need to finish during the lab. You need to finish the tasks in the required time.

6.1. Practice Task 1

[Expected time = 15mins]

Write an assembly program to solve the following equation
 $Res = A + B + (C + D) + E + (F + G)$

Whereas the value of parameters is as follow

- A=1
- B=2
- C=3
- D=4
- E=5
- G=6

At the end the result of the equation should be stored in **Res** variable.

6.2. Practice Task 2

[Expected time = 15mins]

Write an assembly program to solve the following equation

$Res = A - B - (C - D) - E - (F - G)$

Whereas the value of parameters is as follow

- A=6
- B=5
- C=4
- D=3
- E=2
- G=1

At the end the result of the equation should be stored in **Res** variable.

6.3. Practice Task 3

[Expected time = 15mins]

Write an assembly program to solve the following equation

$Res = A + B - (C + D) - E + (F - G)$

Whereas the value of parameters is as follow

- A=3
- B=2
- C=2
- D=1
- E=1
- G=3

At the end the result of the equation should be stored in **Res** variable.

6.4. Practice Task 4

[Expected time = 15mins]

Write an assembly program to solve the following equation

$$\text{Res} = \text{A} - \text{B} - (\text{C} + \text{D}) + \text{E} - (\text{F} - \text{G})$$

Whereas the value of parameters is as follow

- A=4
- B=1
- C=3
- D=2
- E=4
- G=3

At the end the result of the equation should be stored in Res variable.

7. Out comes

After completing this lab, student will be able to compile and run basic Assembly arithmetic operation with their associative properties.

8. Evaluation Task (Unseen) [Expected time = 30mins for tasks]

The lab instructor will give you unseen task depending upon the progress of the class.

9. Evaluation criteria

The evaluation criteria for this lab will be based on the completion of the following tasks. Each task is assigned the marks percentage which will be evaluated by the instructor in the lab whether the student has finished the complete/partial task(s).

Table: Evaluation of the Lab

Sr. No.	Task No	Description	Marks
1		Understanding of Problem	20
2		Program Logic	20
3		Program Implementation	20
4		Program Correctness	10
5		Use of Tool	10
6		Viva	20
